

Redondo Geoduck Tract Conditional Seasonal Boundary, June - November

Due to elevated Fecal Coliform levels observed June – November, a portion of the Redondo Geoduck Tract will have a seasonal closure. The Seasonal closure East boundary is depicted in the map. The lat. Longs. On the map are in decimal degrees so I converted them to decimal minutes, which is what the monitor boat's GPS reports.

There will be two buoys that will mark the seasonal East Boundary; one buoy will be an anchor limit and the other will be the actual boundary. The boundary will be way pointed on the GPS as well. If the buoys are ever missing, please inform the Shellfish Department. It is very important to keep harvest from occurring in the closed area. Any geoduck harvested from the closed area will have to be destroyed.
